Context

0 1

Flow Chosen

Customer places an order. Deepest call chain, real sensitive data exposure, most failure modes to observe.

0 2

Approach

DI + Decorator pattern, two decorators for DB and events, four surgical spans in OrderProcessingService. No business logic modified.

0 3

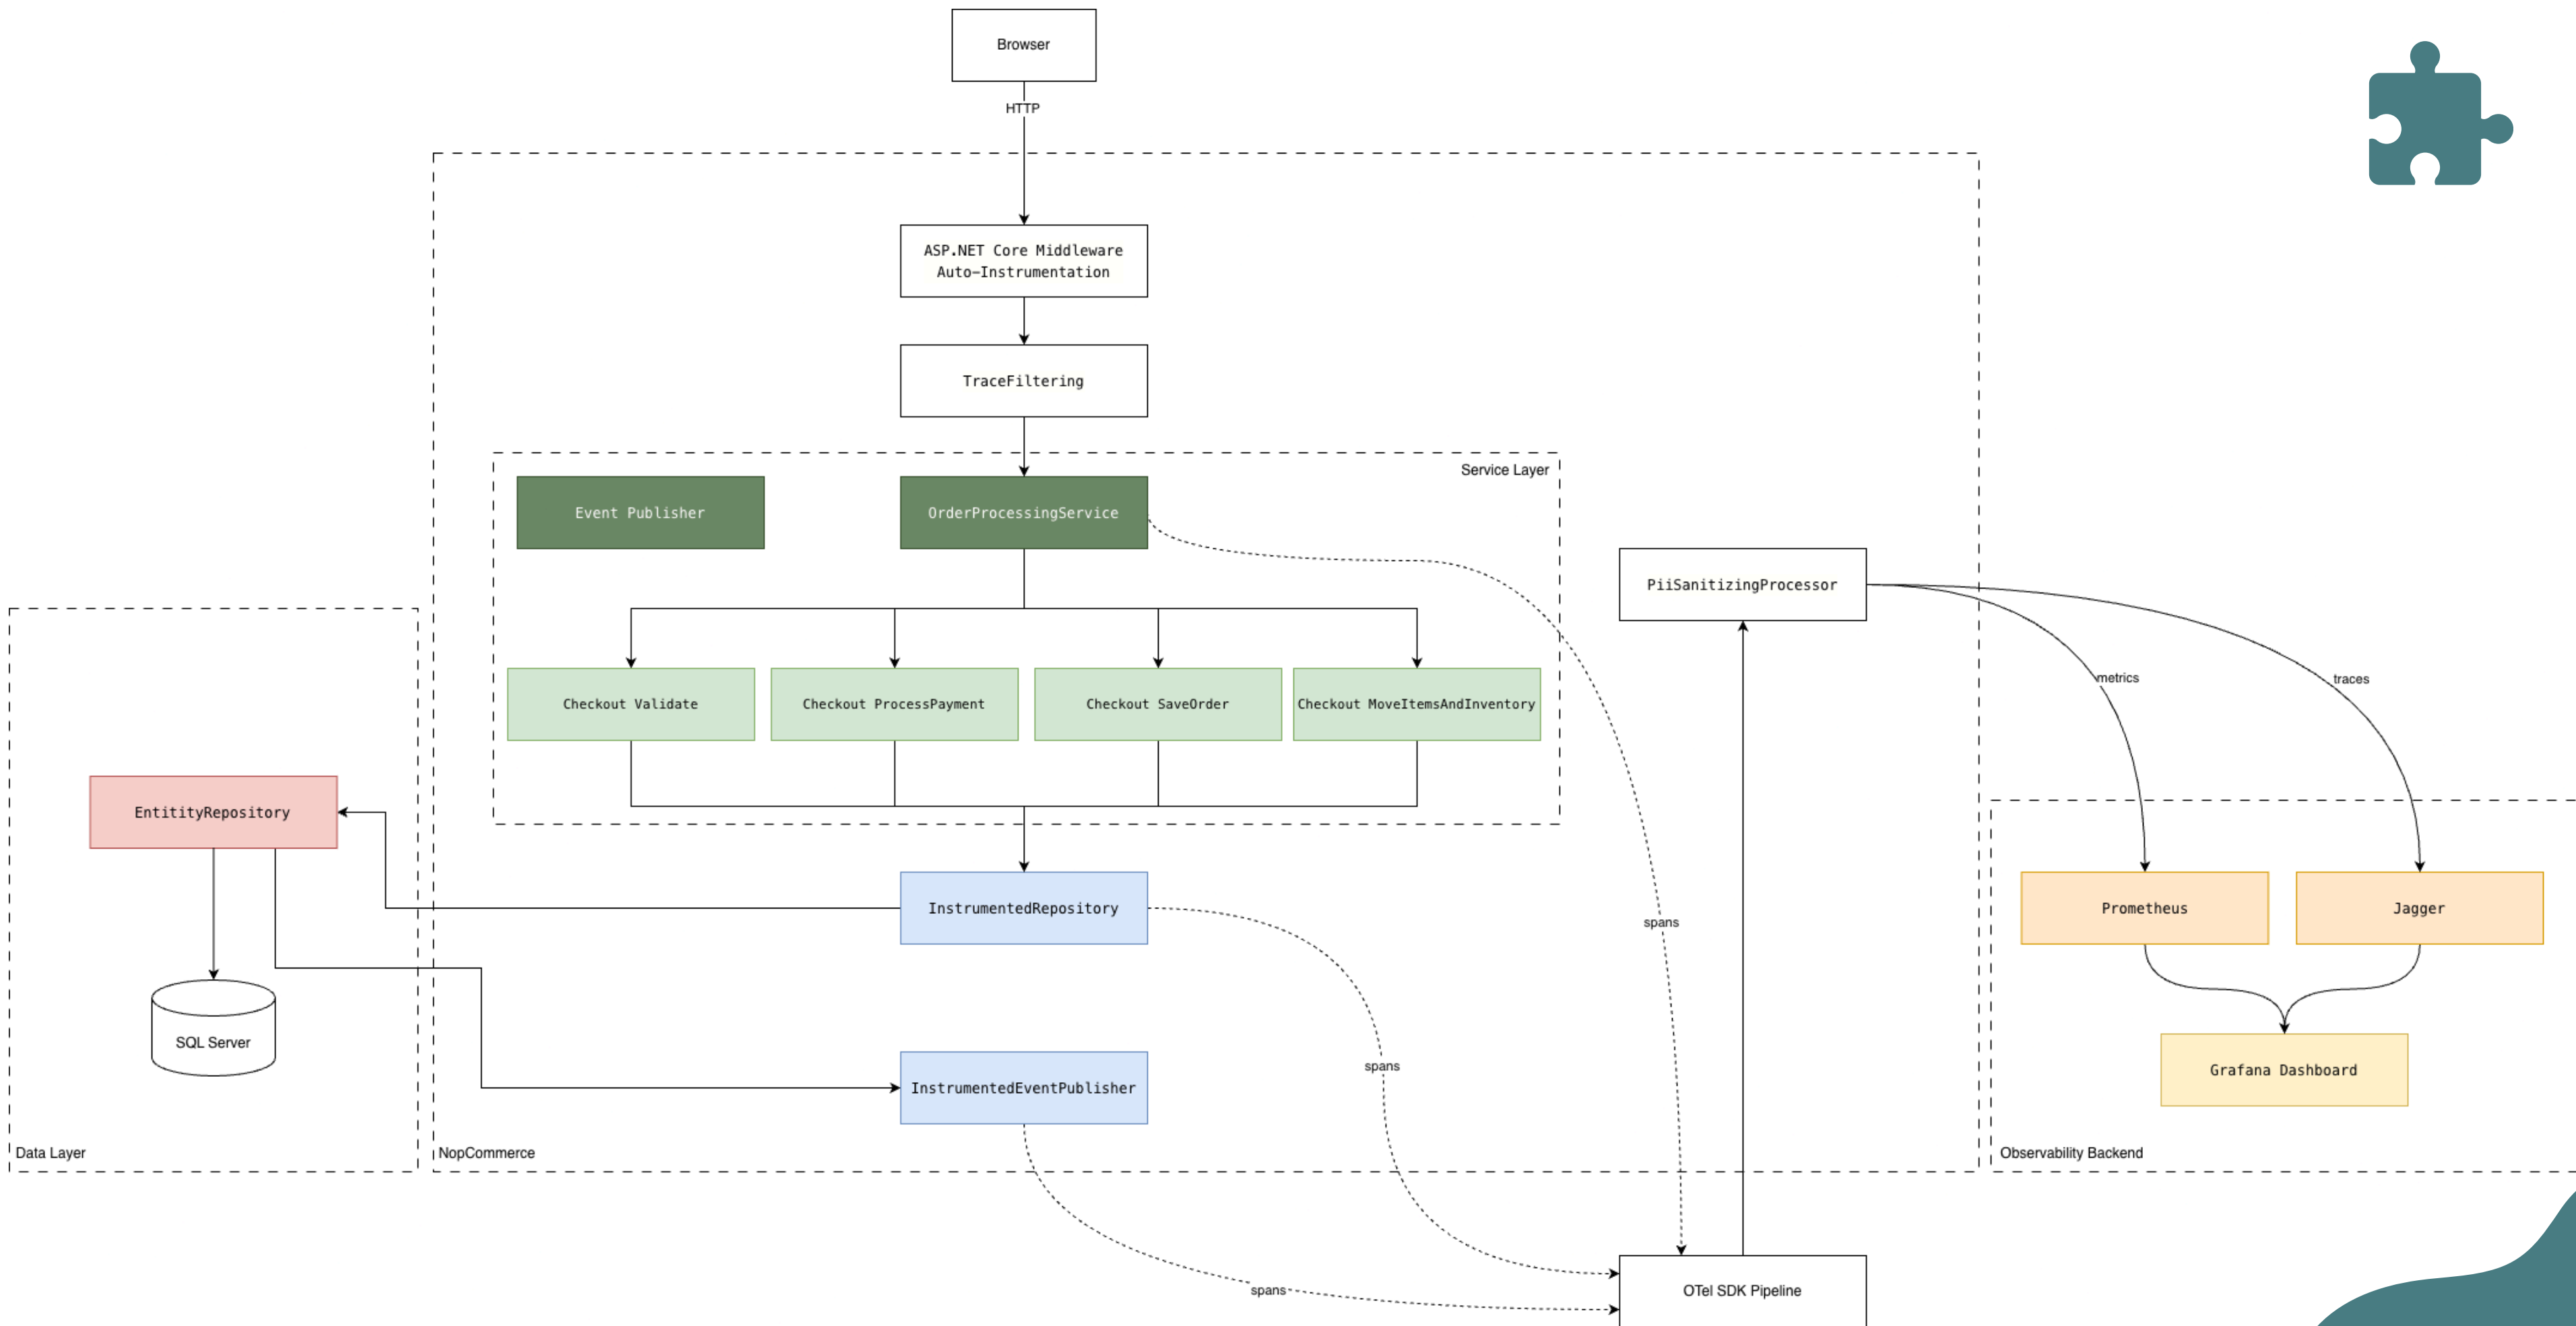

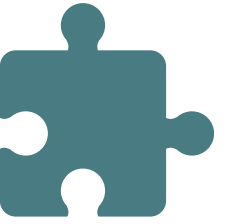

Sensitive Data

A single PiiSanitizingProcessor at the SDK layer redacts emails, card numbers, and addresses from all spans before export.

Metrics

01 Checkout Outcome
Classifies every attempt as success, payment_failed, validation_failed, or error. Instant triage.

02 Checkout Step Duration
Breaks the pipeline into segments (validate, payment, save, inventory). Pinpoints exactly where degradation happens.

03 Payment Method Distribution
Breakdown of which payment methods customers are using. Helps identify customer preferences and detect if a payment provider stops being used.

04 Top Products Sold
Ranking of the most purchased products by units sold. Gives visibility into demand patterns and bestsellers.

05 Orders Placed
Total number of successful orders in the selected time window. Provides a real-time view of store activity.
